- 1. An extended length light emitting diode comprising:
 - a. an extended LED body region substantially integral to and extending and making longer the length of the body of a light emitting diode;
 - the extended length light emitting diode, which b. conforms to a cylindrically geometrically shaped LED body, extends over and a portion of the LED electrical insulating and connection leads, thereby supporting the covered portion of the connection leads;
 - c. such extension of the light emitting diode body terminates as a base which can align flush to a printed circuit board; and,
 - d. the extended length of the light emitting diode allows for auto-insertion into a printed circuit board without an interceding spacer between the printed circuit board and extended length light emitting diode.
